This paper discussed generalized parabolic cylinder function (or GPCF) distribution1 (or GPCFD) probability density function (pdf) in a manner that is original and never presented before in the literature. For GPCF the closed form expression of the cumulative distribution function (cdf) is given by means of series expansion of the four Kampé de Fériet functions and six confluent hypergeometric series of two variables. Numerical results are derived for each case to validate the theoretical models presented in the paper.

Index Terms—Bessel functions, modified Bessel functions, cumulative distribution function, Kampé de Fériet function, series expansion, closed form expression, signal analysis, generalized functions, pdf cdf analysis, hypergeometric series, confluent hypergeometric series of two variables.

1 Introduction

The parabolic cylinder function (PCF) [1] distributions (PCFDs) are distributions that involve the computation of PCF.

The application of PCFDs is limited to gamma like properties as described in (Mathai and Saxena, 1968) [2]. In (Skjong and Madsen 1987) [3] a PCFD is known as the Pierson and Holmes distribution.

Even in Electrical and Computer Engineering the discussion of PCF applications is limited to a small number of publications [4]-[7].

Moreover, the numerical evaluation of the PCF is also limited to special software such as (Wolfram 1999-2016) [8] or a special MATLAB toolbox (Cojocaru, 2009) [9].

Although the pdf of GPCFD was known, I found no references that discuss the cdf of GPCFD. These facts alone demonstrate that the cdf of GPCFD in closed form expression perhaps did not exist prior to this publication.

The real application that generated a very serious interest researching GPCFDs is because of adaptive GPS signal detection based on DCAC and more specifically under the assumption with GPS signal present, the statistics are GPCFDs (Progri et al. 2016, [14], [15]).

This paper presents the first attempt to produce a closed form
expression of the cdf of GPCFD. Although I have produced a closed form expression of the cdf of GPCFD, which contains four Kampé de Fériet functions (Progrí 2016, [13]) and six confluent hypergeometric series of two variables [10], I do not believe that this closed form expression is simplified enough to enable a fast numerical computation of the cdf of GPCFD in MATLAB.

More theorems are needed to prove that indeed the closed form expression of the cdf of GPCFD is indeed a valid cdf.

This paper is organized as follows: in Sect. 2 GPCFD pdf is presented. The series expansion of the GPCFD is discussed in Sect. 3. Section IV contains numerical results; Conclusion is provided in Section V along with a list of references.

2 GPCFD PDF

The GPCFD has its pdf given by

\[
f_{pcd}(x) = \frac{d_0(x) \sum_{k=0}^{N-1} (N-k-1)! [b_0(x)D_{k-N}[c_0(x)] + b_1(x)D_{k-N}[c_1(x)]]}{H_k(N)^{1/2} \sigma^N} \geq 0 \quad (1)
\]

where \(D_k(z)\) is called the PCF (see [10] pg. 1028 9.24-9.25) and \(H_k(N)\) is the Hermite polynomials (see [10] pg. 996 8.95)

\[
a_0(x) = \frac{x-b}{2a^2}; \quad a_0^-(x) = 1 \frac{1}{c^2} - a_0(x); \quad a_0^+(x) = 1 \frac{1}{c^2} + a_0(x) \quad (2)
\]

\[
b_0(x) = e^{a_0(x)}; \quad b_1(x) = e^{a_0(x)} \quad (3)
\]

\[
c_0(x) = aa_0^-(x); \quad c_1(x) = aa_0^+(x) \quad (4)
\]

\[
d_0(x) = e^{-a_0(x)}(x-b) \quad (5)
\]

\[
b = \mu_k \mu_{k+1} \quad (6)
\]

\[
a^2 = c^2 \sum_{k=1}^{N} \mu_k^2; \quad c^2 = \sigma_k^2 \quad (7)
\]

\[
D_k(z) = \frac{1}{2^k \sqrt{\pi}} \frac{1}{\Gamma^2 \left(\frac{k}{2}\right)} \left(\frac{z}{2}\right)^{k-1/2}; \quad z = \{c_0(x), c_1(x)\} \quad (8)
\]

\[
\frac{1}{c} = \frac{2^N \sigma \sigma_{2N}^{2N}}{\sqrt{\pi} (N-1)!} \quad (9)
\]

**Theorem 1**: Prove that the GPCFD \(f_{pcd}(x; a, b, c, N)\) given by (1) is a valid pdf; i.e., prove that two conditions must be met:

\[
f_{pcd,N}(x; a, b, c) \geq 0 \quad (10)
\]

and

\[
f_{pcd}^{\infty} f_{pcd,N}(x, a, b, c) dx = 1 \quad (11)
\]

where \(-\infty < a, b, c < \infty\) and \(N \geq 1\) positive integer.

**Proof of Theorem 1**: Let us prove them one at a time. First in order to prove (10) we must show that for all values of \(-\infty < x < \infty\)

\[
d_0(x) \sum_{k=0}^{N-1} (N-k-1)! [b_0(x)D_{k-N}[c_0(x)] + b_1(x)D_{k-N}[c_1(x)]] \geq 0 \quad (12)
\]

Let us consider the parameters of (12). First, since \(N\) is a positive integer then

\[
N \geq 1 \implies N-1 \geq 0 \implies (N-1)! \geq 0! = 1 > 0 \quad (13)
\]

Hence, substituting (13) into and given that \(\sigma_{2N} > 0\) and \(\sigma > 0\) we have

\[
\frac{1}{c} = \frac{2^N \sigma \sigma_{2N}^{2N}}{\sqrt{\pi} (N-1)!} > 0 \quad (14)
\]

Next, from (5) we have

\[
d_0(x) = e^{-a_0(x-b)} > 0 \quad (15)
\]

Next, in order to show that (12) is true we must show that for \(-\infty < x < \infty\)

\[
H_k(N) \frac{n! [b_0(x)D_{k-N}[c_0(x)] + b_1(x)D_{k-N}[c_1(x)]]}{a^k} \geq 0 \quad (16)
\]

where

\[
n = N - 1 - k > 0, \quad k = \{0,1,\ldots,N-1\} \quad (17)
\]

Let us consider the elements in (17) one at a time. First, since \(a > 0\) then

\[
a^{N-k} > 0 \quad (18)
\]

regardless of \(N\) and \(k\). Next, from (17) we have

\[
n! = (N-1-k)! > 0, \quad k = \{0,1,\ldots,N-1\} \quad (19)
\]

Also from (see [10] pg. 996 8.95 2) we have

\[
H_k(N) = 2^k N^k \left[1 - 2^{-1} \left(\frac{k}{2}\right) N^{-2} + 2^{-2} \cdot 1 \cdot 3 \cdot \left(\frac{k}{4}\right) N^{-4} - 2^{-3} \cdot 1 \cdot 3 \cdot 5 \left(\frac{k}{6}\right) N^{-6} + \ldots\right] \quad (20)
\]

In order to show that \(H_k(N) > 0\) we must show that from (20) the following holds

\[
2^{-1} \left(\frac{k}{2}\right) N^{-2} < 1 \quad (21)
\]

and

\[
2^{-3} \cdot 1 \cdot 3 \cdot 5 \left(\frac{k}{6}\right) N^{-6} < 2^{-2} \cdot 1 \cdot 3 \cdot \left(\frac{k}{4}\right) N^{-4} \quad (22)
\]

or we must show that
\[
\binom{k}{2} < 2N^2; \text{ for } k \geq 2 \text{ and } N \geq 3 \quad (23)
\]
and
\[
5\binom{k}{4} < 2 \cdot \binom{k}{4} N^2; \text{ for } k \geq 4 \text{ and } N \geq 5 \quad (24)
\]
Or we must show that
\[
k(k-1) < 2N^2; \text{ for } k \geq 2 \text{ and } N \geq 3 \quad (25)
\]
and
\[
\frac{5(k-1)(k-2)(k-3)(k-5)}{1 \cdot 2 \cdot 3 \cdot 4 \cdot 5 \cdot 6} < 2 \cdot \frac{k(k-1)(k-2)(k-3)}{1 \cdot 2 \cdot 3 \cdot 4} N^2 \quad (26)
\]
Or we must show that
\[
k^2 - k < 4N^2; \text{ for } k \geq 2, \text{ } N \geq 3 \quad (27)
\]
and
\[
\frac{(k-4)(k-5)}{6} < 2N^2 \quad (28)
\]
Or we must show that
\[
4N^2 - k^2 + k > 0, \text{ for } k \geq 2, \text{ } N \geq 3 \quad (29)
\]
And
\[
(k-4)(k-5) < (k-1)(k-1) < N < 12N^2 \quad (30)
\]
Hence, \(H_k(N) > 0\) for \(k < N\). Hence, in order to prove (16) it remains to show that for \(-\infty < x < \infty\)
\[
b_0(x)D_{k-N}[c_0(x)] + b_1(x)D_{k-N}[c_1(x)] \geq 0 \quad (31)
\]
From the definition of \(b_0\) and \(b_1\) (3) we have
\[
b_0(x) = e^{x^2\sigma_0^2(x)} > 0; \quad b_1(x) = e^{x^2\sigma_1^2(x)} > 0 \quad (32)
\]
From the definition of the PCF (see [10] pg. 1028.94-9.25) we have
\[
D_{k-N}[c_i(x)] > 0 \text{ for } i = \{0,1\} \text{ if } k < N \quad (33)
\]
which is true anyway. So, we have proven that (1) is true.

Next, we have to show that (2) is true. In order to show that (2) is true, we must show that
\[
\int_{-\infty}^{\infty} d_0(x) \sum_{k=0}^{N} \frac{H_k(N)}{c} \left[ b_0(x)D_{k-N}[c_0(x)] + b_1(x)D_{k-N}[c_1(x)] \right] dx = 1 \quad (34)
\]
Or by changing the order of summation and integration we have
\[
\sum_{k=0}^{\infty} \frac{H_k(N)}{c} \int_{-\infty}^{\infty} d_0(x) \left[ b_0(x)D_{k-N}[c_0(x)] + b_1(x)D_{k-N}[c_1(x)] \right] dx = 1 \quad (35)
\]
Or
\[
\sum_{k=0}^{\infty} \frac{\int_{-\infty}^{\infty} d_0(x) b_0(x)D_{k-N}[c_0(x)] dx + \int_{-\infty}^{\infty} d_0(x) b_1(x)D_{k-N}[c_1(x)] dx}{H_k(N)} = 1 \quad (36)
\]
Let us evaluate these integrals separately
\[
g_{0k,N}(a, b, c) = \int_{-\infty}^{\infty} d_0(x)b_0(x)D_{k-N}[c_0(x)] dx \quad (37)
\]
and
\[
g_{1k,N}(a, b, c) = \int_{-\infty}^{\infty} d_0(x)b_1(x)D_{k-N}[c_1(x)] dx \quad (38)
\]
First, from (2) through (5) and (37) we have
\[
g_{0k,N}(a, b, c) = \int_{-\infty}^{\infty} D_{k-N}\left[ a \left( \frac{1, x-b}{2a^2} \right) \right] e^{x^2/2a^2} dy \quad (39)
\]
Let us make the substitution
\[
y = a \left( \frac{1}{\sqrt{2}} \frac{x-b}{2a^2} \right) \quad (40)
\]
We have the following
\[
dy = -\frac{dx}{2a} \quad \Rightarrow \quad x \rightarrow \left[ \frac{y}{\sqrt{2}} \right] \Rightarrow y \rightarrow \left[ \frac{y}{\sqrt{2}} \right] \quad (41)
\]
Substituting (40) and (41) into (39) we have
\[
g_{0k,N}(a, b, c) = -2a \int_{-\infty}^{\infty} e^{-2a^2\left( \frac{y-a^2}{2a^2} \right)^2} e^{x^2/2a^2} D_{k-N}(y) dy \quad (42)
\]
which is equal to
\[
g_{0k,N}(a, b, c) = 2a \int_{-\infty}^{\infty} e^{-y^2/2} e^{x^2/2a^2} D_{k-N}(y) dy \quad (43)
\]
Substituting the result in (see [10] pg. 842.7.724) we have
\[
g_{0k,N}(a, b, c) = \sqrt{\frac{\pi}{2\alpha^2}} \frac{\alpha}{\sqrt{4\pi^2D_{k-N}}} \left[ \frac{a}{\sqrt{2\alpha^2}} \right]^2 \quad (44)
\]
which can be simplified as
\[
g_{0k,N}(a, b, c) = 2a \sqrt{\frac{\pi}{2\alpha^2}} \frac{\alpha}{\sqrt{4\pi^2D_{k-N}}} \left[ \frac{a}{\sqrt{2\alpha^2}} \right] \quad (45)
\]
Similarly, let us solve the second integral.
First, from (2) through (5) and (38) we have
\[
g_{1k,N}(a, b, c) = \int_{-\infty}^{\infty} D_{k-N}\left[ a \left( \frac{1}{\sqrt{2}} \frac{x-b}{2a^2} \right) \right] e^{x^2/2a^2} dy \quad (46)
\]
Let us make the substitution
\[ y = a \left( \frac{1}{2} + \frac{x-b}{2a} \right) \]  
(47)

We have the following
\[ dy = \frac{dx}{2a} ; \ x \rightarrow \sqrt{\frac{b}{a}} \Rightarrow y \rightarrow y_{\infty} \]  
(48)

Substituting (47) and (48) into (46) we have
\[ g_{1k,N}(a, b, c) = 2a \int_{-\infty}^{\infty} e^{-2a^2 \left( \frac{y}{a} \right)^2} e^y D_{k-N}(y) dy \]  
(49)

which is equal to
\[ g_{1k,N}(a, b, c) = 2a \int_{-\infty}^{\infty} e^{-\left( \frac{y-a}{\sqrt{2a}} \right)^2} \frac{y^2}{\sqrt{2\pi}} D_{k-N}(y) \]  
(50)

Substituting the result in (see [10] pg. 842 7.724) we have
\[ g_{1k,N}(a, b, c) = \sqrt{\frac{\pi}{2}} \frac{(2a)^{k-N}}{\sqrt{\pi}} e^{\frac{a^2}{2}} D_{k-N} \left( \frac{2a}{\sqrt{2\pi}} \right) \]  
(51)

which can be simplified as
\[ g_{1k,N}(a, b, c) = 2a \left( \frac{\pi}{2} \right) \frac{(2a)^{k-N}}{\sqrt{\pi}} e^{\frac{a^2}{2}} D_{k-N} \left( \frac{2a}{\sqrt{2\pi}} \right) \]  
(52)

It turns out that
\[ g_{0k,N}(a, b, c) = g_{1k,N}(a, b, c) \]  
(53)

Finally, substituting (53) into (35) we have
\[ 4 \sum_{k=0}^{N-1} \frac{H(k)(N)!}{\sqrt{\pi}} \frac{(2a)^{k-N}}{\sqrt{\pi}} e^{\frac{a^2}{2}} D_{k-N} \left( \frac{2a}{\sqrt{2\pi}} \right) = \]  
(54)

Or we need to set
\[ 4 \left( \frac{\pi}{2} \right) \frac{(2a)^{k-N}}{\sqrt{\pi}} e^{\frac{a^2}{2}} D_{k-N} \left( \frac{2a}{\sqrt{2\pi}} \right) = \]  
(55)

Substituting the value of (9) into (55) we obtain
\[ C = \sqrt{\frac{\pi}{2}(N-1)!} \]  
(56)

Corollary 1: Let us prove that in fact (see [10] pg. 842 7.724) is correct.
Finally, substituting the relations of $D_{-1}(y)$ in (43) we obtain
\[
\int_{-\infty}^{\infty} e^{\frac{-y^2}{4}} D_{-1}(y) dy = \sqrt{\frac{2\pi}{3}} e^{\frac{a^2}{3}} D_{-1}\left(\frac{2}{\sqrt{3}} a'\right)
\] (74)

If we had to use (44) we would have obtained
\[
\int_{-\infty}^{\infty} e^{\frac{-y^2}{4}} D_{-1}(y) dy = \sqrt{\frac{2\pi}{3}} e^{\frac{a^2}{3}} D_{-1}\left(\frac{2}{\sqrt{3}} c'\right)
\] (75)

Again we see that (75) is identical to (74).

This concluded the discussion on the parabolic cylinder function distribution.

### 3 Series Expansion of GPCFD CDF

In this section the series expansion of GPCFD cdf is given. The work that is needed to produce the cdf of GPCFD is not yet completed. Although I have been successful to produce the closed form expression of the cdf of GPCFD its simplification still remains an issue.

#### 3.1 GPCFD CDF

From the definition of the pdf of GPCFD, we define its corresponding cdf as
\[ F_{PCD,N}(x; a, b, c) = \int_{-\infty}^{x} f_{PCD,N}(t; a, b, c) dt \] (76)

\[-\infty < a, b, c < \infty \text{ and } N \geq 1, \text{ which can also be written as} \]
\[ F_{PCD,N}(x) = \frac{\sum_{k=0}^{N-1} \frac{1}{N} \int_{-\infty}^{x} d_0(t) b_0(t) D_{-N}(c_0(t)) dt}{\int_{-\infty}^{\infty} d_0(t) b_0(t) D_{-N}(c_0(t)) dt} \] (77)

where $C$ is given by (56).

Interchanging the order of summation and integration we obtain
\[ F_{PCD,N}(x) = \frac{\sum_{k=0}^{N-1} \frac{1}{N} \int_{-\infty}^{x} d_0(t) b_0(t) D_{-N}(c_0(t)) dt}{\int_{-\infty}^{\infty} d_0(t) b_0(t) D_{-N}(c_0(t)) dt} \] (78)

If we define next
\[ g_{0k,N}(x; a, b, c) = \int_{-\infty}^{x} d_0(t) b_0(t) b_{0}(t) D_{-N}(c_0(t)) dt \] (79)

and
\[ g_{1k,N}(x; a, b, c) = \int_{-\infty}^{x} d_0(t) b_0(t) b_{1}(t) D_{-N}(c_0(t)) dt \] (80)

then if we substitute (79) and (80) into (78) we obtain
\[ F_{PCD,N}(x; a, b, c) = \frac{\sum_{k=0}^{N-1} \frac{1}{N} g_{0k,N}(x; a, b, c) + g_{1k,N}(x; a, b, c) }{\int_{-\infty}^{\infty} d_0(t) b_0(t) D_{-N}(c_0(t)) dt} \] (81)
It remains to compute the functions $g_{0k,N}(x; a, b, c)$ for $i = 0, 1$.

First, from (2) through (5) and (79) we have

$$g_{0k,N}(x; a, b, c) = \int_0^x e^{D_{0k,N}(x)} \, dt$$

where

$$D_{0k,N}(x) = \frac{\sqrt{\pi} \Gamma(\frac{1}{2})}{2a^2} \frac{x^{1-b} y^2}{2a^2} \frac{2a^2}{\gamma(\frac{1}{2}, 1, 2a^2, \frac{y^2}{2a^2})}$$

Let us make the substitution,

$$y = a \left( \frac{1}{c^2} - \frac{t-b}{2a^2} \right)$$

We have the following

$$dy = -\frac{dt}{2a}; \ t \rightarrow \left. x \right|_{t=0}^x \ y \rightarrow \left. a \left( \frac{1}{c^2} - \frac{x-b}{2a^2} \right) \right|_{t=0}^x$$

Substituting (83) and (84) into (82) yields

$$g_{0k,N}(a, b, c) = -2a \int_0^x e^{D_{0k,N}(y)} \, dy$$

where

$$D_{0k,N}(y) = \frac{\sqrt{\pi} \Gamma(\frac{1}{2})}{2a^2} \frac{x^{1-b} y^2}{2a^2} \frac{2a^2}{\gamma(\frac{1}{2}, 1, 2a^2, \frac{y^2}{2a^2})}$$

Substituting (86) into (85) yields

$$g_{0k,N}(a, b, c) = \frac{\sqrt{\pi} \Gamma(\frac{1}{2})}{2a^2} \frac{x^{1-b} y^2}{2a^2} \frac{2a^2}{\gamma(\frac{1}{2}, 1, 2a^2, \frac{y^2}{2a^2})}$$

As we can see the integral (90) can be split into two integrals

$$g_{0k1,N}(a, b, c) = \frac{\sqrt{\pi} \Gamma(\frac{1}{2})}{2a^2} \frac{x^{1-b} y^2}{2a^2} \frac{2a^2}{\gamma(\frac{1}{2}, 1, 2a^2, \frac{y^2}{2a^2})}$$

And

$$g_{0k2,N}(a, b, c) = \frac{\sqrt{\pi} \Gamma(\frac{1}{2})}{2a^2} \frac{x^{1-b} y^2}{2a^2} \frac{2a^2}{\gamma(\frac{1}{2}, 1, 2a^2, \frac{y^2}{2a^2})}$$

Let us try to solve integral (91) based on one definition of the confluent hypergeometric function [11] as follows
\[ \int_0^\infty \frac{u^{k-1}(1-u)^{\mu-1}}{2\pi e^{u^2/2}} \, du = \frac{\Gamma^2(\nu + \mu)}{\sqrt{\pi} \Gamma(\nu + \mu + 1)} \left( \frac{2\alpha}{\gamma} \right)^{\nu + \mu - 1} \] (102)

Changing the order of summation and integration in (102) yields

\[ \int_0^\infty \frac{u^{k-1}(1-u)^{\mu-1}}{2\pi e^{u^2/2}} \, du = \frac{\Gamma^2(\nu + \mu)}{\sqrt{\pi} \Gamma(\nu + \mu + 1)} \left( \frac{2\alpha}{\gamma} \right)^{\nu + \mu - 1} \] (103)

Finally, it remains to solve the integral in (103) as follows (see Gradshteyn, Ryzhik 2007, [10] pg. 317 ex. 3)

\[ \int_0^1 \frac{u^{k-1}(1-u)^{\mu-1}}{(1-\beta u)^r} \, du = B(\lambda, \mu)F(\nu; \lambda + \mu; \beta) \] (104)

Where

\[ \nu = m - \frac{1}{2} \] (105)

\[ \beta = \frac{1}{4} \] (106)

Finally, substituting (104) into (103) produces

\[ \int_0^1 \frac{u^{k-1}(1-u)^{\mu-1}}{(1-\beta u)^r} \, du = \frac{\Gamma^2(\nu + \mu)}{\sqrt{\pi} \Gamma(\nu + \mu + 1)} \left( \frac{2\alpha}{\gamma} \right)^{\nu + \mu - 1} \] (107)

In order to solve the following integral

\[ \int_0^1 \frac{u^{k-1}(1-u)^{\mu-1} \text{erf}(\sqrt{2}u)}{2\pi e^{u^2/2}} \, du = \frac{\Gamma^2(\nu + \mu)}{\sqrt{\pi} \Gamma(\nu + \mu + 1)} \left( \frac{2\alpha}{\gamma} \right)^{\nu + \mu - 1} \] (108)

We need to the series expansion of the \( \text{erf}(\sqrt{2}u) \) (see Gradshteyn, Ryzhik 2007, [10] pg. 889 8.253 ex. 1) as follows

\[ \text{erf}(\sqrt{2}u) = \frac{2}{\sqrt{\pi}} e^{-2u^2} \sum_{m=0}^{\infty} \frac{2m+1}{(2m+1)!} u^{2m+1} \] (109)

Substituting (109) into (108) produces

\[ \int_0^1 \frac{u^{k-1}(1-u)^{\mu-1} \text{erf}(\sqrt{2}u)}{2\pi e^{u^2/2}} \, du = \frac{\Gamma^2(\nu + \mu)}{\sqrt{\pi} \Gamma(\nu + \mu + 1)} \left( \frac{2\alpha}{\gamma} \right)^{\nu + \mu - 1} \] (110)

Where

\[ 2u^2 - \frac{2\alpha u}{\gamma} = 2\alpha x_0^2 - \frac{4\alpha u}{\gamma} \] (111)

In (111) we change the order of summation and integration and we obtain

\[ \int_0^1 \frac{u^{k-1}(1-u)^{\mu-1} \text{erf}(\sqrt{2}u)}{2\pi e^{u^2/2}} \, du = \frac{\Gamma^2(\nu + \mu)}{\sqrt{\pi} \Gamma(\nu + \mu + 1)} \left( \frac{2\alpha}{\gamma} \right)^{\nu + \mu - 1} \] (112)

It remains to simplify and solve the integral in (112). But first we must simplify the following

\[ u^{2m+1} = (\bar{u}x_0 - a\bar{u}^{-1}c^{-2})^{2m+1} \] (113)

We expand (113) using the binomial expansion (see Arfken and Weber 1995, [12], pg. 317 binomial theorem) as follows

\[ u^{2m} = x_0^{2m}\bar{u}^{2m+1}(1 - a\bar{u}^{-1}c^{-2})^{m'} \] (114)

Where

\[ m' = 2m + 1 \] (115)

Or

\[ u^{2m} = x_0^{2m}\bar{u}^{2m+1} \sum_{q=0}^{\infty} \frac{m'}{q} (-a\bar{u}^{-1}c^{-2})^q \] (116)

Substituting (116) into (112) yields,

\[ \int_0^1 \frac{u^{k-1}(1-u)^{\mu-1} \text{erf}(\sqrt{2}u)}{2\pi e^{u^2/2}} \, du = \frac{\Gamma^2(\nu + \mu)}{\sqrt{\pi} \Gamma(\nu + \mu + 1)} \left( \frac{2\alpha}{\gamma} \right)^{\nu + \mu - 1} \] (117)

Changing again the order of summation and integration in (117) yields

\[ \int_0^1 \frac{u^{k-1}(1-u)^{\mu-1} \text{erf}(\sqrt{2}u)}{2\pi e^{u^2/2}} \, du = \frac{\Gamma^2(\nu + \mu)}{\sqrt{\pi} \Gamma(\nu + \mu + 1)} \left( \frac{2\alpha}{\gamma} \right)^{\nu + \mu - 1} \] (118)

Finally, it remains to solve the integral in (118) as follows (see Gradshteyn, Ryzhik 2007, [10] pg. 349 3.285)

\[ \int_0^1 \frac{u^{k-1}(1-u)^{\mu-1}}{(1-\frac{1}{2})} \, du = \frac{\Phi(\lambda - 2m, \lambda; \mu; -\frac{x_0^2}{\gamma})}{e^{-2u^2}x_0^2\gamma} \] (119)

Next, substituting (119) into (118) we obtain

\[ \int_0^1 \frac{u^{k-1}(1-u)^{\mu-1} \text{erf}(\sqrt{2}u)}{2\pi e^{u^2/2}} \, du = \frac{\Gamma^2(\nu + \mu)}{\sqrt{\pi} \Gamma(\nu + \mu + 1)} \left( \frac{2\alpha}{\gamma} \right)^{\nu + \mu - 1} \] (120)

Next, substituting (107) and (120) into (93) yields
Next, substituting (121) into (91) yields,

\[
\int_0^\infty \frac{y^2}{e^{2y^2/(\alpha^2)}} dy = \int_0^\infty \frac{y^2}{e^{2y^2/(\alpha^2)}} dy
\]

Changing the order of integration in (123) produces

\[
\int_0^\infty \frac{y^2}{e^{2y^2/(\alpha^2)}} dy = \int_0^\infty \frac{y^2}{e^{2y^2/(\alpha^2)}} dy
\]

In order to solve (124) first we have to solve the following integral

\[
\int_0^\infty \frac{y^2}{e^{2y^2/(\alpha^2)}} dy = \int_0^\infty \frac{y^2}{e^{2y^2/(\alpha^2)}} dy
\]

Equation (125) can be written as follows

\[
\int_0^\infty \frac{y^2}{e^{2y^2/(\alpha^2)}} dy = \int_0^\infty \frac{y^2}{e^{2y^2/(\alpha^2)}} dy
\]

Next, we recognize that exponent of the exponential function inside the integral in (125) can be written as

\[
y^2u^2 - 2yu + a^2 = (uy - \frac{a}{u^2}) - a^2\left(\frac{u}{4-u}\right)
\]

Next, substituting (127) into (125) yields

\[
\int_0^\infty \frac{y^2}{e^{2y^2/(\alpha^2)}} dy = \int_0^\infty \frac{y^2}{e^{2y^2/(\alpha^2)}} dy
\]
Next, we have to solve the following integral by substituting (101) as follows

\[
\int \frac{u^{w-1}(1-u)^{w-1}}{(1-u)^2e^2} du = \int \frac{u^{w-1}(1-u)^{w-1} e^{\frac{2a^2c^2}{c^2}}}{(1-u^2)^2 e^2} du
\]

Changing the order of summation and integration into (141) yields

\[
\int \frac{u^{w-1}(1-u)^{w-1}}{(1-u)^2 e^2} du = \frac{\sum_{m=0}^{\infty} \left(1 \frac{(2a^2-4m)\Phi_1 v\nu \frac{\gamma \nu \gamma}{\Gamma \nu \gamma}}{(1-\nu^2)\gamma \nu \gamma} \right)}{2a^2 c^2}
\]

Next, we have to solve the following integral using (109)

\[
\int \frac{u^{w-1}(1-u)^{w-1} e^{\frac{2a^2c^2}{c^2}}}{(1-u)^2 e^2} du = \int \frac{u^{w-1}(1-u)^{w-1}}{(1-u)^2 e^2} du + \int \frac{2a^2c^2}{c^2} \sum_{m=0}^{\infty} \frac{(1-\nu^2)\gamma \nu \gamma}{(1-\nu^2)\gamma \nu \gamma} \frac{2a^2c^2}{c^2}
\]

In (144) changing the order of summation and integration and substituting (111) yields

\[
\int \frac{u^{w-1}(1-u)^{w-1} e^{\frac{2a^2c^2}{c^2}}}{(1-u)^2 e^2} du = \frac{2a^2c^2}{c^2} \sum_{m=0}^{\infty} \frac{(1-\nu^2)\gamma \nu \gamma}{(1-\nu^2)\gamma \nu \gamma} \frac{2a^2c^2}{c^2}
\]

Next, we substitute (116) into (145) and we obtain

\[
\int \frac{u^{w-1}(1-u)^{w-1} e^{\frac{2a^2c^2}{c^2}}}{(1-u)^2 e^2} du = \frac{2a^2c^2}{c^2} \sum_{m=0}^{\infty} \frac{(1-\nu^2)\gamma \nu \gamma}{(1-\nu^2)\gamma \nu \gamma} \frac{2a^2c^2}{c^2}
\]

Changing again the order of summation and integration in and after simplifications (146) yields

\[
\int \frac{u^{w-1}(1-u)^{w-1} e^{\frac{2a^2c^2}{c^2}}}{(1-u)^2 e^2} du = \frac{2a^2c^2}{c^2} \sum_{m=0}^{\infty} \frac{(1-\nu^2)\gamma \nu \gamma}{(1-\nu^2)\gamma \nu \gamma} \frac{2a^2c^2}{c^2}
\]

Finally, it remains to solve the integral in (147) as follows

\[
\int \frac{u^{w-1}(1-u)^{w-1} e^{\frac{2a^2c^2}{c^2}}}{(1-u)^2 e^2} du = \frac{\Phi_1 \left(\frac{u}{1-u}, \frac{a^2c^2}{c^2}, \frac{2a^2c^2}{c^2} \right)}{2a^2 c^2} = \frac{\Phi_1 \left(\frac{u}{1-u}, \frac{a^2c^2}{c^2}, \frac{2a^2c^2}{c^2} \right)}{2a^2 c^2}
\]

Next, substituting (147) into (148) we obtain

\[
\int \frac{u^{w-1}(1-u)^{w-1} e^{\frac{2a^2c^2}{c^2}}}{(1-u)^2 e^2} du = \frac{\Phi_1 \left(\frac{u}{1-u}, \frac{a^2c^2}{c^2}, \frac{2a^2c^2}{c^2} \right)}{2a^2 c^2}
\]

Finally, if we substitute (122) and (151) into (90) yields

\[
g_{k2,\nu}(a, b, c) = \frac{2a^2 c^2}{\Gamma \nu \gamma \nu \gamma} \frac{2a^2 c^2}{\Gamma \nu \gamma \nu \gamma} \frac{2a^2 c^2}{\Gamma \nu \gamma \nu \gamma}
\]

(see Gradshteyn, Ryzhik 2007, [10] pg. 349 3.385)
Second, from (2) through (5) and (80) we have
\[ g_{ok,N}(a, b, c) = \int_0^\infty \frac{D_{k=N}(\frac{1}{y})}{(y-a^2)^2} \, dy \] (153)
Let us make the substitution,
\[ y = a \left( \frac{1}{z^2} + \frac{b}{2a^2} \right) \] (154)
We have the following
\[ dy = \frac{dt}{z^2}; \quad t \rightarrow 1 \Rightarrow y \rightarrow a \left( \frac{1}{z^2} + \frac{b}{2a^2} \right) \] (155)
Substituting (155) and (154) into (153) yields
\[ g_{1k,N}(a, b, c) = 2a \int_0^\infty \frac{D_{k=N}(y)}{e^{2a^2(y-a^2)} - e^{2a^2(y+b^2/2a^2)}} \, dy \] (156)
where
\[ x_1 = a \left( \frac{1}{z^2} + \frac{b}{2a^2} \right) \] (157)
Substituting (86) into (156) yields
\[ g_{1k,N}(a, b, c) = \frac{\Phi \left( \frac{\lambda^2}{2}, \frac{2}{2} \right) \sqrt{2} \Phi \left( \mu^2, \frac{2}{2} \right)}{2^{\lambda+\mu} \Gamma(\lambda) \Gamma(\mu)} \int_0^\infty \frac{1}{e^{2(a^2-a^2)} - e^{2(a^2+b^2/2a^2)}} \, dy \] (158)
As we can see the integral (158) can be split into two integrals
\[ g_{1k1,N}(a, b, c) = \frac{a \sqrt{\pi}}{2^{\lambda+\mu} \Gamma(\mu)} \int_0^\infty \frac{\Phi \left( \frac{\lambda^2}{2}, \frac{2}{2} \right)}{e^{2a^2(y-a^2)}} \, dy \] (159)
And
\[ g_{1k2,N}(a, b, c) = -\frac{a \sqrt{\pi}}{2^{\lambda+\mu} \Gamma(\mu)} \int_0^\infty \frac{1}{e^{2a^2(y-a^2)}} \, dy \] (160)
There are two ways to solve the integral in (159). The first way would be as follows:
\[ \int_0^\infty \frac{\Phi \left( \frac{\lambda^2}{2}, \frac{2}{2} \right)}{e^{2a^2(y-a^2)}} \, dy = 1 - \int_0^\infty \frac{\Phi \left( \frac{\lambda^2}{2}, \frac{2}{2} \right)}{e^{2a^2(y-a^2)}} \, dy \] (161)
Hence, (159) can be obtained from (122) as follows
\[ g_{1k1,N}(a, b, c) = 1 - g_{ok1,N}(a, b, c) \] (162)
Similarly, (160) can be obtained from (151) as follows
\[ g_{1k2,N}(a, b, c) = 1 - g_{ok2,N}(a, b, c) \] (163)
The second way is by means of direct integration.
Let us try to solve integral (159) based on one definition of the confluent hypergeometric function [11] as follows
\[ \int_{x_1}^{x_2} \frac{\Phi \left( \frac{\lambda^2}{2}, \frac{2}{2} \right)}{e^{2a^2(y-a^2)}} \, dy = \frac{\Gamma(\lambda+\mu) \Gamma(\mu)}{\Gamma(\mu) \Gamma(\mu-1)} \] (164)
Changing the order of integration in (164) produces
\[ \int_{x_1}^{x_2} \frac{\Phi \left( \frac{\lambda^2}{2}, \frac{2}{2} \right)}{e^{2a^2(y-a^2)}} \, dy = \int_{x_1}^{x_2} \frac{\Phi \left( \frac{\lambda^2}{2}, \frac{2}{2} \right)}{e^{2a^2(y-a^2)}-e^{2a^2(y+b^2/2a^2)}} \, dy \] (165)
In order to solve (165) first we have to solve the following integral
\[ \int_{x_1}^{x_2} \frac{u^{2}}{e^{2a^2(y-a^2)}} \, dy = \int_{x_1}^{x_2} \frac{u^{2}}{e^{2a^2(y-a^2)}} \, dy \] (166)
From (Gradsteyn, Ryzhik 2007, [10] pg. 108 2.33 ex. 1) we have
\[ \int_{x_1}^{x_2} \frac{u^{2}}{e^{2a^2(y-a^2)}} \, dy = \frac{1}{2} e^{2a^2(y-a^2)} \left[ \frac{2a^2(y-a^2)}{e^{2a^2(y-a^2)}} \right] \] (167)
Equation (167) can be simplified as
\[ \int_{x_1}^{x_2} \frac{u^{2}}{e^{2a^2(y-a^2)}} \, dy = \frac{1}{2} e^{2a^2(y-a^2)} \left[ 1 + e^{2a^2(y-a^2)} \right] \] (168)
Without any loss of generality following the derivations from (100) to (121) and keeping in mind (167) we can arrive at the
following result
\[
\int_{-\infty}^{\infty} \frac{\phi(\frac{1}{2}x^2)}{e^{2ax^2(\frac{1}{a} - \frac{1}{2})}} \, dx = 2a^2 \frac{\sqrt{\pi} \cdot 2^{m-1}}{m!} f(v, \lambda, \beta + \frac{1}{2}) + \sum_{m=0}^{\infty} \frac{\left(\frac{m}{2}\right)_{m}}{m!} \left(\frac{\lambda - 2m + \mu}{\frac{1}{2} - \frac{1}{2}}\right)^{2m-1} \sqrt{\pi} \cdot 2^{m} \Gamma(2m+1) \right]
\]
(169)
\[
\text{Substituting (169) into (159) produces}
\[
\frac{\Phi_{\lambda}(\alpha_1; \omega)}{2a^2} + \frac{\Gamma(2m+1) \cdot 2^m \cdot (2m+1)!}{m!} \frac{1}{\sqrt{\pi}} \cdot 2^{m} \Gamma(2m+1) \right]
\]
(170)
\[
\text{Without any loss of generality we can obtain}
\[
\frac{\Phi_{\lambda}(\alpha_1; \omega)}{2a^2} + \frac{\Gamma(2m+1) \cdot 2^m \cdot (2m+1)!}{m!} \frac{1}{\sqrt{\pi}} \cdot 2^{m} \Gamma(2m+1) \right]
\]
(171)
\[
\text{Finally, if we substitute (170) and (171) into (158) yields}
\[
\frac{\Phi_{\lambda}(\alpha_1; \omega)}{2a^2} + \frac{\Gamma(2m+1) \cdot 2^m \cdot (2m+1)!}{m!} \frac{1}{\sqrt{\pi}} \cdot 2^{m} \Gamma(2m+1) \right]
\]
(172)
\[
\text{yields for the first time the closed form series expression of the cdf of the generalized parabolic cylinder function.}
\]
\[
\text{3.2 A Simplified Series Expansion of GPCFD CDF}
\]
Now that we have produced GPCFD cdf we will simplify it to enable its calculation via MATLAB.
\[
\text{The first simplification comes from the definition of the Beta function as follows}
\[
B(\lambda, \mu) = \frac{\Gamma(\lambda + \mu)}{\Gamma(\lambda) \Gamma(\mu)} \Rightarrow B(\lambda, \mu) = \frac{1}{\Gamma(\lambda + \mu)}
\]
(174)
\[
\text{The second simplification is due to the numerical values of} \lambda + \mu \text{in (89); hence,}
\[
\frac{B(\lambda, \mu)}{\Gamma(\lambda) \Gamma(\mu)} = \frac{1}{\Gamma(\lambda + \mu)} \Rightarrow \frac{\sqrt{\pi} B(\lambda, \mu)}{\Gamma(\lambda) \Gamma(\mu)} = 1
\]
(175)
\[
\text{The third simplification is because of recursion formula of the gamma function}
\[
\Gamma(\lambda + 1) = \lambda \Gamma(\lambda) \Rightarrow \Gamma\left(\frac{1}{2} + 1\right) = \frac{1}{2} \Gamma\left(\frac{1}{2}\right)
\]
(176)
\[
\text{The fourth simplification results from the following}
\[
\sum_{m=0}^{\infty} \frac{2^a m}{m!} \frac{1}{\Gamma(\lambda + \mu)} = \sum_{m=0}^{\infty} \frac{2^a m}{m!} \sum_{m=0}^{\infty} \frac{(-1)^m}{m!} \frac{1}{\Gamma(\lambda + \mu)}
\]
(177)
\[
\text{which can be written as}
\[
\sum_{m=0}^{\infty} \frac{2^a m}{m!} \frac{1}{\Gamma(\lambda + \mu)} = \sum_{m=0}^{\infty} \sum_{l=0}^{\infty} \frac{(-1)^{m+l}}{m!} \frac{1}{\Gamma(\lambda + \mu)}
\]
(178)
\[
\text{Or this can be written with the help of the Kampé de Fériet function [13] as follows}
\[
\sum_{m=0}^{\infty} \frac{2^a m}{m!} \frac{1}{\Gamma(\lambda + \mu)} = \sum_{m=0}^{\infty} \frac{(-1)^m}{m!} \frac{1}{\Gamma(\lambda + \mu)}
\]
(179)
\[
\text{Similarly,}
\[
\sum_{m=0}^{\infty} \frac{2^a m}{m!} \frac{1}{\Gamma(\lambda + \mu)} = \sum_{m=0}^{\infty} \frac{(-1)^m}{m!} \frac{1}{\Gamma(\lambda + \mu)}
\]
(180)
\[
\text{Substituting (175) through (180) into (152) and (172) yields}
\[
\frac{\Phi_{\lambda}(\alpha_1; \omega)}{2a^2} + \frac{\Gamma(2m+1) \cdot 2^m \cdot (2m+1)!}{m!} \frac{1}{\sqrt{\pi}} \cdot 2^{m} \Gamma(2m+1) \right]
\]
(181)
\[
\text{Next, one can substitute (152) and (172) into (81) which}
\]
(81)
The numerical, theoretical results section contains a few examples. At that time I will also construct a series of theorems that are needed to prove that indeed the GPCFD CDF given by (81) is a valid CDF.

Next, the simplification of the following term is needed:

\[ \sum_{m=0}^{\infty} \frac{\alpha m^m \gamma(\alpha m) q_1(\alpha m)}{\Gamma(\alpha m)} \left( \frac{1}{\Gamma(\alpha m)} \right)^{\alpha m} =? \]  

The simplification of (183) is not easy obtainable. After the simplification of (183) is completed then I believe the next step would be the computation of the closed form expression of the CDF of GPCFD via MATLAB.

At that time I will also construct a series of theorems that are needed to prove that indeed the GPCFD CDF given by (81) is a valid CDF.

4 Numerical, Theoretical Results

The numerical, theoretical results section contains a few simplified examples.

4.1 Examples

Figure 1 presents three scenarios of the PDFs pdf and CDF. In Fig. 1 (a) we have assumed that \( a = 1 \), \( p = 1 \); and (top) \( b = 1 \); (bottom) \( b = 0 \).
The results of Fig. 1 (b) are similar to those of Fig. 1 (a) for values of \(a = 2\), \(p = 2\); and (top) \(b = 2\); (bottom) \(b = 0\). It appears that the mean of the parabolic cylinder random variable is equal to \(b\). The shape of the parabolic cylinder pdf and cdf is very close to that of a normal or Gaussian. We should also say that GPCFD pdf and cdf exists only for integer values of \(p\). In Fig. 1 (c) we have employed the results of Fig. 1 (b) but we have produced half GPCFD pdf and cdf.

This concluded the discussion on examples and numerical, theoretical results.

Once, the analytical work for the computation of the cdf of the GPCFD is completed and verified then its computation is possible via MATLAB.

I am going to publish it as soon as it becomes available.

5 Conclusions

We have been able to produce for the first time the complete discussion of the GPCFD pdf. We have showed that this is a valid pdf function and we have produced the valid normalized coefficient. This work is original and never published before in a journal paper.

We have been able to produce for the first time the closed form expression of the cdf of the GPCFD which contains four Kampé de Fériet functions (Progri 2016, [13]) and six confluent hypergeometric series of two variables [10].

Nevertheless, we do not believe that this closed form expression is simplified enough to enable a fast numerical computation of the cdf of the GPCFD in MATLAB.

We have also shown why more theorems are needed to prove that indeed the closed form expression of the cdf of the GPCFD is indeed a valid cdf.

Once all this work is completed then the differentiation theorem is also needed to be proved to show that indeed the cdf of the GPCFD is exactly the one coming from the pdf of the GPCFD. The differentiation theorem might also lead to the computation of the derivative of the Kampé de Fériet functions (Progri 2016, [13]) and six confluent hypergeometric series of two variables [10].

Once all this work is completed then the analysis of my initial publication on [16]-[27] need to be reworked to consider scenarios valid for GPCFDs.

valid pdfs. We will neither show how to compute the main statistics nor will we show how to compute the closed form expression of the PCFDs cdf and later its inverse. The computation of the PCFDs pdf was performed using the MATLAB toolbox developed by Cojocaru [9] in January 2009. As far as I can tell the PCFDs are introduced for the first time in the navigation community and as of January 2016 there were only four papers [4]-[7] that had discussion on parabolic cylinder functions in the IEEE Xplore; hence, Progri et al. 2016 [14], [15] presented a unique opportunity to introduce and discuss the PCFDs in a navigation related topic namely adaptive GPS signal detection based on DCAC.
